

# Turtle<sup>®</sup> Rip Repair Fasteners

For Temporary Repair of Tears or Longitudinal Belt Rips  
(NOT for use in joining the ends of conveyor or transmission belts)

1. Place a wood support under belt where rip is to be repaired. Do not install Turtle<sup>®</sup> fasteners using the conveyor pulley or other metal surface as support, as fastener teeth would not be properly cinched.

2. While holding ripped edges together place plates 4-6° apart with the fastener straddling both sides of the rip. A Turtle fastener may also be used at the end of a rip to prevent continued tearing.

3. Drive fastener teeth into the belt and supporting board with a hammer. Avoid hitting the center of the plate.

4. After plates are driven, cinch teeth from underside, inward toward rip.  
**NOTE: When fastener teeth are cinched, do not continue to hammer—excessive hammering will weaken the repair.**

2525 Wisconsin Avenue • Downers Grove, IL 60515-4200 U.S.A.
