Product Notes:

- Divided into three equal sections along the pulley face. Middle section is flat, while end sections taper at a ratio of 1:150.
- Crown lagging has minimal effect on very slow conveyors, contrary to faster rotating pulleys which generate higher gyroscopic force to pull the belt back to the centre.
- Not for use with drive pulleys or head pulleys, as the lagging can adversely affect tension and cause belt shift or can affect the trajectory of the product into transfer chutes and negatively affect cleaner performance.
- Not to be used on pulleys that run steel cord belts.
